

The three features I have on my website is the loading page, the drawing animations, and the flying birds.

The loading page was designed with the same color scheme to create an entrance into the site and to give the animations time to load. The loading screen moves out horizontally to reveal the nav bar and the drawing animation.

The drawing animation was created by hand in illustrator where I created an SVG and animated the path. Perfecting this was the most time consuming part of the project.

When you hover your mouse over the sky birds should appear and fly across the screen as if you are looking at a live sunset.

While there is a lot I would have liked to add, I simply did not have enough time to create my other pages at the same level of quality as I spent on the home page. I plan to add more interactive elements to the other pages
